Research Note
v2.1

The purpose is not to calm the mind, but to remove what blocks intensity.

With Unreal Tournament or Quake

Novice AI level.

Only use the basic gun.

While playing, do an ugly shoulder movement: not a dance, a move really ugly, disordered, non-rhythmic.

At some point, drink a sip of coffee, a random dose between very tiny and tiny. Continue playing.

Then stop, and listen to a music of your choice.

1 to 2 times per day.

Low-evaluation exercises that minimally activate monitoring and can be used in-game:

Ugly micro-movement: make a deliberately ugly movement, without rhythm, disordered.

Ask a question without answering it. The question can be absurd or incomplete, like “what if?”, “are we going to?”, “why the?”

Move as if you had a goal, confidently, then change direction for no reason.

Bring your aim very precisely onto an element (enemy, corner, object), then stop correcting entirely, even if it becomes wrong immediately.

Start tracking a bot cleanly, then let the tracking degrade.

Align with a corridor or a line in the environment, then let your trajectory drift.

Anticipate a position (door, exit), place your aim correctly, then do nothing when someone appears.

Be precise, then become completely imprecise without transition.

When a bot appears, start treating it as the target, then let that status dissolve.

Enter a corridor as if it were the right path, then lose that sense before reaching the end.

Start shooting as if the action will become structured, then let the firing lose its logic.

Look at an area as if something is about to happen, then drop that expectation.

When you die, do not treat death as an outcome, just as a clean cut of the micro-task.

Optional: As soon as any in-game event occurs, the micro-task automatically ends:

Bot appears

You get hit

Zone change

Pickup weapons or bonus

Death

Music (after the task):

Start a track, then stop it as soon as it begins to feel slightly good. The key is not to search for the “best moment”. As soon as you feel a small shift, even vague, you stop. No need to be sure. Sometimes you cut very early, sometimes at the very beginning of the shift, sometimes a bit after, sometimes you stop almost immediately.

Switch to another track for no identifiable reason.

Switch to another track without evaluating the previous one.

Listen while keeping the feeling “almost good”, without trying to push it further.

Restart the beginning of a track multiple times without ever letting it continue.
